

## THE WAND

Many patients are averse to the use of conventional needles in administering local anaesthetic to numb you prior to any dental treatment. At Healthy Smiles @ Mt Eliza, we reduce the 'sting' sensation that is commonly associated with the use of a conventional syringe. The Wand is also known as the single tooth anaesthesia (STA) unit that helps to achieve precise targeted delivery, so that it is slow, steady and comfortable for the patient.

Administration of anaesthetic through the use of 'the Wand' helps makes this experience much less frightening at Healthy Smiles @ Mt Eliza through its computer assisted flow of anaesthetic. The reduced feeling of sting and more importantly reducing face-numbness decreases the discomfort level as the anaesthetic is administered at a low rate that is below the normal pain threshold. The amount of anaesthetic used is also reduced.

### Key Benefits

- Wand causes less anxiety than any other method of injection (Kudo et al, 2001).
- A superior control of the rate of flow of anaesthetic makes dental procedures comfortable.
- Better control of anaesthetic flow helps post anaesthetic recovery quicker.
- Elimination of the feeling of "Face and Lip Numbness".
- After a dental procedure you can smile properly without the feeling of face numbness!
